

HEAT™ (Hybrid Expandable Anchoring Technology) Hydraulic Setting Tool

The HEAT hydraulic setting tool uses differential hydraulic pressure to generate the required expansion forces needed to set the HEAT hanger.

Features and Benefits

- Modular design allows for setting force customization based on customer requirements or wellbore conditions
- Balance pistons protect setting cylinders from differential collapse and help prevent debris from affecting tool function
- Clutch lock connections reduce risk of back-off while transferring torque during rotating, reaming, or drilling-with-liner
- Accommodates high compressive loading and rotational forces
